

ABSTRACT OF THE DISCLOSURE

A cargo carrier (10) for bicycles (Y1, Y2) is removably installable in the bed (B) of a truck (T) and has a base plate (12) which mounts on top of the truck bed. One side of the base plate bears against one wall (W1) of the truck bed and an adjustable stop (14) is adjustable to bear against the opposite wall (W2) so to allow the carrier to be installed in trucks having different bed widths. Saddles (40) have risers (42) extending vertically upwardly from the base plate. An attachment screw (62) extending between the risers is used for securing bicycles to the carrier. The base plate may include an offset section so two bicycles can be carried in a side-by-side, staggered formation. The saddles are removable and can be replaced with posts or mounts for carrying other items in the bed. The carrier is in kit form for quick assembly, when needed.
